# Production Deployment Runbook

**Document ID:** DOC-001

**Owner:** Platform Engineering

**Status:** Active

**Version:** 3.2

**Last Updated:** 2025-02-14

**Environment:** Production

## Purpose

This runbook defines the standard procedure for releasing application changes to the NexusScale production environment.

The procedure applies to customer-facing services managed by the central Platform Engineering team.

## Deployment Prerequisites

All required CI checks have completed successfully.

The release artifact has passed vulnerability scanning.

Database migrations have been reviewed by the service owner.

A rollback version is available.

The designated release manager has approved the deployment window.

## Deployment Procedure

Production releases are initiated through the Jenkins release pipeline.

After the pipeline completes the pre-deployment validation stage, the deployment pauses for manual approval.

The release manager is responsible for reviewing the deployment summary, including affected services, migration status, and rollback readiness, before approving the production rollout.

No production deployment should proceed without explicit approval from an authorized release manager.

## Emergency Changes

Emergency changes may use an expedited deployment process when an active customer-impacting incident requires immediate remediation.

The incident commander must document the reason for the expedited deployment in the incident record.
