CI/CD Pipeline Migration Guide

Document ID: DOC-002

Owner: Developer Productivity

Status: Active

Version: 2.0

Last Updated: 2026-01-20

Environment: Production

Overview

NexusScale has completed the migration of its standard application delivery workflow from Jenkins to GitHub Actions.

All services onboarded to the centralized delivery platform must use the approved GitHub Actions workflow templates.

Production Releases

Production releases are triggered automatically after required test suites pass, security scanning completes successfully, required deployment checks are successful, and the release is scheduled within an approved deployment window.

For services using the standardized production workflow, no manual release-manager approval is required after automated validation has completed.

Legacy Pipelines

Jenkins pipelines remain operational only for services that have not yet completed migration.

Teams maintaining legacy pipelines must complete migration planning with Developer Productivity before the end of the current platform support cycle.

Rollback

Each standardized deployment workflow automatically records the previous stable release and supports rollback through the GitHub Actions deployment interface.
